CERTIFICATE

This is to certify that the below mentioned students:

Examination Seat No.	Name of the Student	Branch
	CHAUDHARI BHAGYESH JAYENDRA	Computer

This is to certify that, **Chaudhari Bhagyesh Jayendra** is studying in TE Computer Engineering course in SEM VI and he has successfully completed my internship , entitled “**Sales Analysis of Blinkit Using Power BI**”. This study is a partial fulfilment of the degree of Bachelors of Engineering in Computer Engineering of Savitribai Phule Pune University, during the academic year 2026-2027.

INTERNSHIP LETTER

To,

CHAUDHARI BHAGYESH JAYENDRA

Nashik

We are happy to offer you internship in our organization from 05-January-2026 for the period of 1.5 Months. You will be involved in various activities of projects related to Data Analytics. We are confident that you will play a significant role in projects assign with your team.

You have to follow all rules and regulation of our organization and show keen interest toward task assigned you.

Thank You

Dinesh Deore

Mob 9422248005

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who supported and guided me in the successful completion of my project titled “**Sales Analysis of Blinkit Using Power BI.**”

First and foremost, I am deeply thankful to my project guide for their valuable guidance, continuous support, and constructive suggestions throughout the development of this project. Their insights helped me understand the practical applications of Business Intelligence and data visualization tools.

I would also like to thank our respected faculty members and institution for providing me with the opportunity to work on this project and for equipping me with the necessary knowledge and skills in data analysis.

I am grateful to the developers of **Microsoft Power BI**, which made it possible to create an interactive and insightful dashboard for analyzing sales data of **Blinkit**.

Finally, I extend my heartfelt thanks to my family and friends for their encouragement, motivation, and moral support throughout the completion of this project.

ABSTRACT

This project titled “**Sales Performance Analysis of Blinkit Using Power BI**” aims to analyze and interpret sales data to generate meaningful business insights using modern Business Intelligence techniques. In today’s competitive retail and quick-commerce industry, data-driven decision-making plays a crucial role in improving operational efficiency and increasing profitability. This project focuses on examining the business performance of **Blinkit**, one of India’s leading quick-commerce platforms, through interactive data visualization and analytical tools.

The dataset used in this study contains detailed information related to product categories, item types, fat content, outlet size, outlet location type, outlet establishment year, item visibility, sales figures, and customer ratings. Before performing the analysis, data cleaning and preprocessing were conducted to handle missing values, remove inconsistencies, and standardize the dataset for accurate reporting.

The project utilizes **Microsoft Power BI** to design and develop an interactive dashboard. Various data visualization techniques such as bar charts, pie charts, line charts, and KPI cards were implemented to represent the information in a clear and understandable format. Key Performance Indicators (KPIs) including Total Sales, Average Sales, Total Number of Items Sold, and Average Customer Rating were calculated to evaluate overall business performance.

Through detailed analysis, the project identifies high-performing outlet sizes, top-selling product categories, and the impact of outlet location on revenue generation. It also highlights trends in customer preferences and purchasing behavior. The dashboard enables easy comparison between different outlet types and provides insights into which factors significantly influence sales performance.

The findings of this project demonstrate that business intelligence tools can transform raw data into actionable insights. The developed dashboard helps in strategic planning, performance monitoring, and identifying growth opportunities. Overall, this study emphasizes the importance of data analytics in improving operational efficiency and supporting managerial decision-making in the retail and quick-commerce sector.

1.INTRODUCTION

In today's digital era, businesses generate a vast amount of data through their daily operations. The ability to analyze and interpret this data effectively has become essential for achieving competitive advantage and sustainable growth. Business Intelligence (BI) tools play a crucial role in transforming raw data into meaningful insights that support strategic decision-making. This project focuses on analyzing sales data using BI tools to evaluate business performance and identify improvement opportunities.

The study is based on the sales data of Blinkit, one of India's leading quick-commerce platforms. Blinkit operates in the online grocery and essentials delivery segment, providing customers with fast and convenient doorstep delivery services. With increasing competition in the retail and e-commerce industry, it has become important for companies to monitor their performance across various parameters such as sales trends, product demand, outlet performance, and customer satisfaction.

The primary aim of this project is to analyze Blinkit's sales dataset and develop an interactive dashboard using Microsoft Power BI. Power BI is a powerful data visualization and business analytics tool that enables users to create reports, dashboards, and interactive visualizations for better understanding of data patterns and trends.

The dataset used in this project contains detailed information including item types, item fat content, outlet size, outlet location type, outlet establishment year, item visibility, sales amount, and customer ratings. Before analysis, the data was cleaned and transformed to ensure accuracy and consistency. Missing values were handled, incorrect entries were corrected, and appropriate data formatting was applied.

The developed dashboard includes Key Performance Indicators (KPIs) such as Total Sales, Average Sales, Total Items Sold, and Average Rating. Various visual representations such as bar charts, pie charts, and line graphs were used to analyze different aspects of the business. The dashboard provides insights into which outlet sizes generate the highest revenue, which product categories are most popular, and how location influences sales performance.

Through this project, an attempt has been made to understand how data visualization can help businesses identify strengths, weaknesses, and growth opportunities. The insights derived from the dashboard can support management in making informed decisions related to expansion planning, product strategy, and operational efficiency.

Overall, this project highlights the importance of Business Intelligence in modern retail and quick-commerce industries and demonstrates how analytical tools like Power BI can convert raw data into actionable insights.

1.1 Introduction to Power BI

Microsoft Power BI is a business analytics tool developed by Microsoft that allows users to visualize data and share insights across organizations.

Key Features:

- Interactive dashboards
- DAX calculations
- Data modeling
- Real-time reporting

This project uses Power BI to analyze Blinkit's sales dataset.

2. INDUSTRY OVERVIEW

2.1 Quick Commerce Industry

Quick commerce (Q-commerce) is a fast-growing retail model that delivers products within 10–30 minutes.

Major characteristics:

- Hyperlocal warehouses
- Technology-driven logistics
- High customer demand
- Competitive pricing

2.2 Market Growth in India

The Indian quick-commerce market has grown significantly due to:

- Urbanization
- Smartphone usage
- Changing customer behavior

2.3 Competitive Landscape

Major competitors:

- Zepto
- Swiggy Instamart
- BigBasket

Blinkit maintains strong competition using operational efficiency and analytics.

3. DATA ANALYSIS

The data analysis was performed using **Microsoft Power BI** on the sales dataset of **Blinkit**. The purpose of this analysis is to evaluate business performance, identify revenue drivers, and support data-driven decision-making.

The dashboard includes multiple visualizations such as KPI cards, bar charts, pie charts, donut charts, line charts, and slicers to provide interactive insights.

3.1 Overall Sales Performance Analysis

The first stage of analysis focuses on overall business performance using Key Performance Indicators (KPIs):

- **Total Sales** – Measures total revenue generated.
- **Average Sales** – Shows average revenue per product/outlet.
- **Total Items Sold** – Indicates total product demand.
- **Average Rating** – Reflects customer satisfaction level.

These KPIs provide a snapshot of business health. High total sales combined with strong average ratings indicate a positive market position.

3.2 Sales Distribution by Outlet Type

Sales were analyzed across different outlet types such as Grocery Stores and Supermarkets.

Findings:

- Supermarket-type outlets contribute a major portion of total sales.
- Grocery stores show stable but comparatively lower revenue.

This indicates that customers prefer larger outlets offering variety and convenience.

3.3 Sales Analysis by Outlet Size

Outlets were categorized into Small, Medium, and Large sizes.

Key Observations:

- **Medium-sized outlets generate the highest revenue contribution.**
- Small outlets show limited sales due to restricted product variety.
- Large outlets perform well but may involve higher operational costs.

This suggests that medium-sized outlets provide an optimal balance between cost and revenue.

3.4 Location-Based Performance Analysis

The sales were segmented based on location tiers:

- Tier 1 (Metro Cities)
- Tier 2 (Developing Cities)
- Tier 3 (Smaller Cities)

Findings:

- Tier 1 cities generate the highest sales due to higher demand and purchasing power.
- Tier 2 cities show growth potential.
- Tier 3 cities contribute less but represent future expansion opportunities.

This insight is crucial for expansion strategy and marketing planning.

3.5 Product Category (Item Type) Analysis

Different product categories such as:

- Dairy
- Frozen Foods
- Snacks
- Soft Drinks
- Household Items

were analyzed to identify top-performing segments.

Key Findings:

- Essential items (Dairy, Snacks, Grocery items) contribute the highest share.
- Certain categories show seasonal demand variations.
- High-demand categories directly influence total revenue growth.

This helps management in:

- Inventory optimization
 - Stock replenishment planning
 - Promotional campaign planning
-

3.6 Fat Content Analysis (Low Fat vs Regular)

Products were categorized into Low Fat and Regular items.

Observations:

- Regular fat products contribute slightly higher sales volume.
- However, Low Fat items show steady growth, indicating increasing health awareness.

This insight supports targeted marketing strategies.

3.7 Establishment Year Trend Analysis

The analysis of sales based on outlet establishment year shows:

- Recently established outlets are performing competitively.
- Older outlets maintain stable revenue patterns.
- Overall growth trend indicates business expansion success.

This reflects effective location planning and market penetration.

3.8 Customer Rating & Satisfaction Analysis

Customer ratings were analyzed to understand service quality.

Key Insights:

- Average ratings remain high across most outlet types.
- Higher-rated outlets generally show stronger sales performance.
- Customer satisfaction positively impacts repeat purchases.

Maintaining high service quality is essential for sustained growth.

3.9 Comparative Analysis & Pattern Identification

By combining multiple filters (location + outlet size + product type), deeper insights were generated:

- Medium outlets in Tier 1 cities show maximum profitability.
 - Certain product categories perform better in specific location tiers.
 - Sales distribution is not uniform, highlighting the need for region-specific strategies.
-

3.10 Business Impact of Data Analysis

The analysis provides strategic value in:

- Revenue forecasting
- Market expansion planning
- Inventory management
- Customer behavior understanding
- Profit optimization

Using Power BI visualization tools improves clarity, reduces manual reporting effort, and supports faster business decisions.

4. DATA ANALYSIS OF BLINKIT BY DASHBOARD

4.1 Key Performance Indicators (KPIs)

The dashboard includes the following major KPIs:

- **Total Sales** – Represents the overall revenue generated.
- **Average Sales** – Indicates average revenue per outlet or item.
- **Total Items Sold** – Shows total quantity of products sold.
- **Average Rating** – Reflects customer satisfaction level.

These KPIs provide a quick overview of overall business performance and help in evaluating growth and efficiency.

4.2 Sales Analysis by Outlet Size

The analysis of sales based on outlet size (Small, Medium, High) shows how physical store capacity impacts revenue generation.

It was observed that **medium-sized outlets contribute significantly to total sales**, indicating an optimal balance between operational cost and sales volume. Smaller outlets generate comparatively lower revenue, while large outlets show steady but not always proportionate growth.

This insight helps management understand which outlet size should be prioritized for expansion.

4.3 Sales Analysis by Outlet Location Type

The dashboard compares sales across different location tiers (Tier 1, Tier 2, Tier 3 cities).

The analysis indicates that **Tier 1 cities generate the highest revenue**, followed by Tier 2 cities. This suggests that urban areas with higher population density and purchasing power contribute more to total sales.

Location-based insights are useful for expansion planning and marketing strategy development.

4.4 Product Category Analysis

Sales were analyzed based on item types such as snacks, dairy products, beverages, frozen foods, and household items.

The analysis shows that **certain product categories consistently generate higher revenue**, indicating strong customer demand. This helps in identifying best-selling products and optimizing inventory management.

Additionally, analysis based on **item fat content (Low Fat vs Regular)** reveals customer preference trends, which can assist in product positioning and marketing decisions.

4.5 Outlet Establishment Year Analysis

Sales were examined based on outlet establishment year to identify growth trends over time.

The analysis suggests that outlets established in recent years show competitive performance, indicating effective operational strategies and increasing demand in new locations.

This trend reflects the company's growth potential and expansion success.

4.6 Customer Rating Analysis

Customer ratings were analyzed to measure satisfaction levels.

The **average rating remains consistently high**, indicating positive customer experiences. Higher ratings generally correlate with better sales performance, showing the importance of service quality and product availability.

Maintaining high customer satisfaction is essential for repeat purchases and long-term growth.

4.7 Overall Findings from Data Analysis

From the detailed analysis, the following conclusions can be drawn:

- Medium-sized outlets perform better in terms of revenue generation.
- Tier 1 locations contribute the highest share of total sales.
- Certain product categories dominate overall sales.
- Customer satisfaction levels are strong and positively impact revenue.
- Expansion strategies in high-performing regions can further increase profitability.

6. FORMULAS USED IN DASHBOARD

a) TOTAL SALE

DAX Formula: Total Sales = SUM(Blinkit[Sales])

b) AVERAGE SALES

DAX Formula: Average Sales = AVERAGE(Blinkit[Sales])

c) TOTAL ITEMS SOLD

DAX Formula: Total Items Sold = SUM(Blinkit[Item_Outlet_Sales_Quantity])

d) AVERAGE RATING

DAX FORMULA : Average Rating = AVERAGE(Blinkit[Rating])

e) SALES BY OUTLET TYPE

DAX FORMULA : % Sales Contribution =

DIVIDE(

SUM(Blinkit[Sales]),

CALCULATE(SUM(Blinkit[Sales]), ALL(Blinkit))

) * 100

f) YEAR-WISE SALES GROWTH

DAX FORMULA : Sales Growth = CALCULATE(

SUM(Blinkit[Sales]),

FILTER(

ALL(Blinkit),

Blinkit[Outlet_Establishment_Year] = MAX(Blinkit[Outlet_Establishment_Year])

)

)

g) HIGH SALES FLAG (Conditional Column)

DAX FORMULA : High Sales Category =

IF(Blinkit[Sales] > 5000, "High", "Low")

7.Important DAX Functions Used

Function	Purpose
SUM()	Adds numeric values
AVERAGE()	Finds mean value
COUNT()	Counts rows
CALCULATE()	Changes filter context
ALL()	Removes filters
FILTER()	Applies condition
DIVIDE()	Safe division
IF()	Logical condition

8. DASHBOARD OUTPUT

9. RECOMMENDATIONS

9.1 Focus on High-Performing Outlet Types

The analysis shows that **medium-sized outlets** and outlets located in **Tier 1 cities** generate the highest revenue.

Recommendation:

- Expand more outlets in Tier 1 and high-demand urban areas.
- Increase inventory capacity in medium-sized outlets.
- Allocate more marketing budget to high-performing regions.

9.2 Improve Low-Performing Outlet Categories

Certain outlet sizes and Tier 3 locations show lower sales performance.

Recommendation:

- Introduce localized promotional campaigns.
- Offer discounts and combo offers to increase sales.
- Improve delivery speed and service quality in these areas.

9.3 Optimize Product Category Strategy

Some product categories contribute significantly to total sales, while others have lower demand.

Recommendation:

- Increase stock availability for high-demand product categories.
- Reduce overstocking of slow-moving items.
- Introduce seasonal or trending products based on customer behavior.

9.4 Enhance Customer Satisfaction

Average rating analysis shows room for improvement in customer experience.

Recommendation:

- Improve packaging quality.
- Reduce delivery time.
- Train delivery staff for better customer interaction.
- Monitor feedback regularly using dashboard insights.

9.5 Strengthen Data-Driven Decision Making

The Power BI dashboard provides real-time insights into sales, outlet performance, and product trends.

Recommendation:

- Use the dashboard weekly for performance review meetings.
- Track KPIs such as Total Sales, Average Sales, and Customer Rating regularly.
- Implement predictive analytics for future sales forecasting.

9.6 Improve Inventory Management

Data indicates variation in item visibility and stock rotation.

Recommendation:

- Maintain optimal stock levels based on demand patterns.
- Use sales trends to forecast inventory requirements.
- Reduce wastage by improving supply chain coordination

9.7 Increase Marketing Efficiency

Certain regions and outlet types show higher responsiveness to sales activities.

Recommendation:

- Run targeted digital marketing campaigns in high-conversion areas.
- Offer personalized discounts based on purchase behavior.
- Use customer segmentation for better promotional strategies

10. LIMITATIONS

10.1 Limited Dataset Scope

The analysis is based on the available dataset only.

The dataset may not include:

- Complete historical sales data
- Seasonal variations across multiple years
- External factors such as economic conditions

Therefore, the insights are limited to the given data sample.

10.2 Lack of Real-Time Data

The dashboard was created using static data.
It does not reflect:

- Real-time sales updates
- Current market trends
- Live customer behavior

This may limit its use for real-time decision-making.

10.3 Missing or Incomplete Information

Some fields in the dataset may have:

- Missing values
- Approximate ratings
- Limited customer demographic details

This reduces the depth of customer behavior analysis.

10.4 No External Market Comparison

The project focuses only on Blinkit's internal sales data.
It does not compare performance with:

- Competitor platforms
- Industry benchmarks
- Market growth rates

Hence, competitive positioning analysis is limited.

10.5 Tool Constraints

Although Power BI is powerful, it has limitations such as:

- Performance issues with very large datasets
- Limited advanced statistical modeling compared to Python/R
- Dependency on proper data modeling for accurate results.

11. FINDINGS

Based on the analysis of the Blinkit sales dataset using Power BI, the following key findings were identified:

1.1. Overall Sales Performance

- The total sales performance indicates steady revenue generation across different outlet types.
 - Sales distribution shows that certain outlet categories contribute significantly more to overall revenue.
 - The dashboard highlights clear differences in performance based on outlet size and location.
-

11.2 Outlet Size Performance

- **Medium-sized outlets** generate the highest total sales.
 - Small-sized outlets contribute comparatively lower revenue.
 - This suggests that moderate infrastructure size is more efficient for sales performance.
-

11.3 Location-Based Analysis

- Outlets located in **Tier 1 cities** show higher revenue generation.
- Tier 2 cities demonstrate moderate performance.
- Tier 3 locations contribute the least to total sales.

This indicates that urban areas have stronger purchasing power and higher demand.

11.4 Outlet Type Analysis

- Supermarket-type outlets contribute more revenue compared to grocery store-type outlets.
 - Established outlets with better infrastructure show improved sales figures.
 - Outlet format plays an important role in influencing customer purchase behavior.
-

11.5 Product Category Insights

- Certain product categories show higher demand and revenue contribution.
 - Fast-moving consumer goods (FMCG) categories perform better than niche categories.
 - Product diversification impacts overall sales performance.
-

11.6 Fat Content Analysis

- Regular fat products show slightly higher sales contribution compared to low-fat products.

- Consumer preference varies based on product category and availability.
-

11.7 Establishment Year Impact

- Older outlets with more years in operation tend to generate consistent revenue.
 - Newly established outlets are still in growth phase and show lower contribution.
-

11.8 Customer Rating Analysis

- Average customer ratings indicate satisfactory service levels.
 - However, minor variations suggest improvement opportunities in service quality and delivery experience.
-

11.9 KPI-Based Findings

From the dashboard KPIs:

- Total Sales show strong revenue potential.
- Average Sales per transaction indicate healthy order values.
- Total Items Sold reflect product demand.
- Average Rating suggests acceptable customer satisfaction levels.

12. CONCLUSION

The “Sales Analysis of Blinkit Using Power BI” project successfully demonstrates how Business Intelligence tools can transform raw data into meaningful insights for strategic decision-making.

Through the use of Microsoft Power BI, the Blinkit sales dataset was cleaned, modeled, and visualized into an interactive dashboard that highlights key performance indicators such as:

- Total Sales
- Average Sales
- Total Items Sold
- Average Customer Rating
- Outlet Performance by Size and Location
- Product Category Contribution

The analysis clearly indicates that medium-sized outlets and Tier 1 city locations generate higher revenue compared to other categories. Certain product types show stronger demand, suggesting opportunities for inventory optimization and targeted marketing strategies. Customer rating trends also provide insight into service quality and areas needing improvement.

The dashboard provides a clear visual representation of business performance, enabling faster and more effective decision-making. By using DAX formulas, data modeling techniques, and interactive filters, the project illustrates the practical application of data analytics in the quick-commerce industry.

Although the study has certain limitations such as limited dataset scope and absence of real-time data, it effectively achieves its primary objectives. The project proves that Power BI is a powerful tool for sales analysis, performance tracking, and business optimization.

In conclusion, this project highlights the importance of data-driven decision-making in modern businesses. By leveraging analytics tools like Power BI, companies like Blinkit can enhance operational efficiency, improve customer satisfaction, and achieve sustainable growth in a competitive market environment.

STUDENT DECLARATION

I hereby declare that the project report entitled “Sales Performance Analysis of Blinkit Using Power BI” submitted in partial fulfillment of the requirements for the award of my academic program is an original work carried out by me.

This project has not been submitted to any other university or institution for the award of any degree, diploma, or certificate. The data used in this project has been collected from available sources and analyzed using Microsoft Power BI for academic purposes only.

I further declare that all sources of information used in this project have been properly acknowledged and cited in the references section.

I take full responsibility for the authenticity and originality of this project report.
